

## Gerotor Pumps

# Product series 143

for oil

for use in SKF CircOil centralized lubrication systems

Gerotor pump unit in foot design

Gerotor pump unit in flange design

Gerotor pump+pump flange+shaft coupling

SKF gerotor pump units of product series 143 are self-priming positive-displacement pumps with fixed displacement and high efficiency. They are used in SKF CircOil centralized lubrication systems for a variety of tasks and applications, especially in circulating-oil and total-loss lubrication systems.

The durable and rugged gerotor pump unit was designed and manufactured in Germany.

#### Fields of application

- General mechanical and plant engineering
- Shipbuilding and offshore industry
- Paper, printing, and pulp industries
- Heavy industry

#### Advantages

- Flexible delivery range from 0.85 to 50 l/min at system pressures up to 50 bar
- Large viscosity range for standard mineral and synthetic lubricating and hydraulic oils from 20 to 1000 mm<sup>2</sup>/s
- Ambient temperature of 0 to +40°C

- Low volumetric flow pulsation and thus very smooth running
- Gerotor with a cycloid contour and thus good suction characteristics
- Low-noise
- Gerotor pumps are available in NBR and FKM (FPM) designs.
- Squirrel cage motors are available in different voltage designs for 50 and 60 Hz.
- Compact design
- Modular ordering system (order as a complete pump unit, single pump, or pump with flange and shaft coupling)

## Note:

The technical data in this publication provide for general information. Follow the assembly instructions and any instructions on and accompanying the products when performing assembly, operating, and maintenance.

Technical data and selection and ordering data, including availability, for accessories are subject to change.

## Important information on product usage

SKF and Lincoln lubrication systems or their components are not approved for use with gases, liquefied gases, pressurized gases in solution and fluids with a vapor pressure exceeding normal atmospheric pressure (1 013 mbar) by more than 0,5 bar at their maximum permissible temperature.

CAD models for the products shown in this brochure can be downloaded at:

## Fundamentals

### General use

SKF gerotor pump units of product series 143 are used in circulating-oil and total-loss lubrication systems in a flow rate range of 0.85 to 50 l/min. The standard permissible ambient temperature is between 0 and +40 °C. Higher ambient temperatures are possible, though they lead to a reduction in motor performance and thus the delivery rate. The permissible temperature of the pumped medium is between 0 and +80°C. The gerotor pumps are available in NBR and FKM (FPM) designs.

SKF gerotor pump units feed lubricating and hydraulic oils from a reservoir and into the pipe system of a centralized lubrication system. In doing so, they increase the energy of the pumped medium (pressure increase) to overcome flow resistance in the pipelines (pressure loss), the components (filters, valves, distributors) and the bearings and friction points. SKF gerotor pump units of different types and performance ratings are used depending on the type and size of the centralized lubrication system and the lubricant.

### Applications

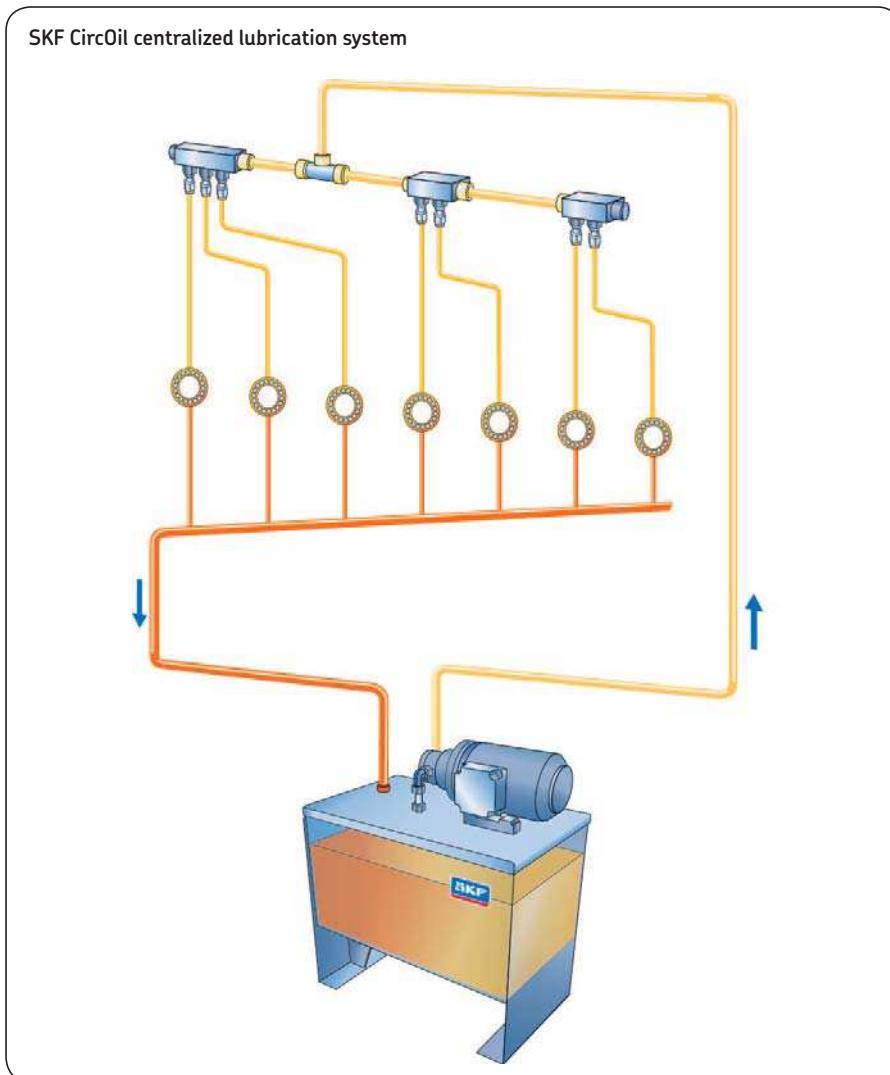

The main area of application is the broad field of circulating-oil and total-loss lubrication systems for general mechanical engineering and plant engineering applications. Here, the focus is on lubricating and cooling heavily loaded bearings and friction points for a wide range of uses. SKF gerotor pump units are used primarily as lubricating, hydraulic, hydrostatic, and cooling oil pumps. They can be set up either as single pumps or integrated into a reservoir unit. Other areas include the shipbuilding and offshore industry as well as the paper, printing, pulp, and heavy industries.

### Delivery rates and characteristic curves

The nominal delivery rates indicated in the catalog refer to the nominal output multiplied by the speed of the motor. The actual delivery rate changes with operating viscos-

ity and back pressure and can be found in the characteristic curve diagrams in the catalog. These diagrams are based on the range between 20 and 1000 mm<sup>2</sup>/s in increments of 20, 140, 750, and 1000 mm<sup>2</sup>/s. Each gerotor pump has a characteristic curve represented as a function of the delivery rate above the delivery pressure (back pressure).

It is important to note that temperature influences can render lubricating and hydraulic oils extremely thin or viscous. Please consult with us in advance if you will use lubricating and hydraulic oils with an operating viscosity outside the specified range.

# Gerotor pumps, product series 143

## Fundamentals

### Design (Figure 1)

SKF gerotor pump units of product series 143 have a constant displacement volume and one delivery circuit.

The annular-toothed feeding element, also referred to as the gerotor, is equipped with a cycloid contour, which creates a large tooth meshing length. This yields a low volumetric flow pulsation and thus very smooth running, low noise production, and good suction characteristics.

SKF gerotor pumps consist primarily of pump housing (1), the shaft (2), the displacement elements toothed rotor (3) and annular gear (4), and the lid (5).

### Suction and displacement process (Fig. 1)

The shaft drives the centrally mounted toothed rotor in the indicated direction of rotation via a feather key. The toothed rotor meshes with the outer, eccentrically mounted annular gear and rotates with it. The openings between teeth arising in the suction area (S) draw the pumped medium in. The suction and pressure area is separated from the tooth meshing area (Z) by a radial gap (R) formed by the tooth profiles of the annular gear and the toothed rotor as they slide onto one another. In the pressurized area (P), the fluid is fed to the pressure port through increasingly small chambers.

### Drive

SKF gerotor pump units of product series 143 are driven by IEC squirrel cage motors sized 63 to 132 in the standard design. The motors are designed for a rated motor voltage of 230/400 V or 400/690 V for 50 networks according to DIN IEC 60038. The normal coils used here in motors with performance < 0.75 kW are designed for the wide voltage range. The normal coils in motors with performance  $\geq 0.75$  kW are tailor-made and meet the IE2 efficiency level according to EU Directive 2009/125/EC. Special voltage versions with special coils for 50 Hz and 60 Hz networks are available for order.

The standard design of the motors comes with a terminal box. Motors with UL/CSA certification are available. Further certifications are available on request.

### Shaft coupling

The shaft couplings are designed as curved-tooth couplings. Curved-tooth couplings are flexible shaft connections for positive torque transmission. The material combination of steel hub and polyamide sleeve used for the curved-tooth couplings permits maintenance-free continuous duty with very low friction on the teeth. They, therefore, do not require any lubrication or maintenance and are nearly wear-free in operation.

### Installation

SKF gerotor pump units of product series 143 can be installed both horizontally and vertically. Foot or flange versions are available for each gerotor pump unit design.

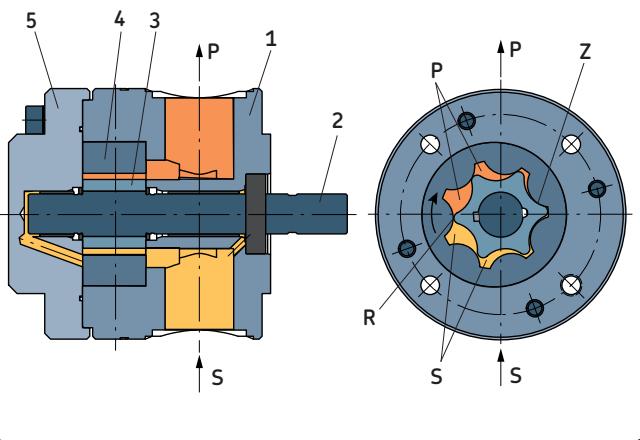

When the gerotor pump unit is set up separately from the reservoir, the suction port on the pump can be connected to a reservoir at a higher position (max. 2000 mm).

To flange the gerotor pump unit to a reservoir horizontally below the oil level, use a sealed pump in a special design. Please consult our Engineering department in advance.

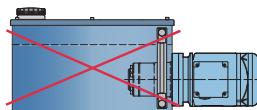

In its design as a pump with flange and coupling, various technical designs of customer-specific electrical motors can be used. The flange allows for the installation of all IEC standard motors with a flange according to DIN EN 50347, design FT (with threaded holes). See the drawings in this publication for the geometric dimensions of the flange.

If only gerotor pumps without a motor are used, for example as an integrated/attached pump on a machine housing, ensure that no radial or axial load is applied to the drive shaft. The pumps can be installed in any position.

### Technical data

Flow rate range . . . . .	0.85 to 50 l/min
Pressure, max. . . . .	50 bar
Pumped medium . . . . .	Lubricating and hydraulic oils
Operating viscosity . . . . .	20 to 1000 mm <sup>2</sup> /s
Drive speed depending on design . . . . .	1400 and 2800 rpm
Protection class acc. to DIN EN 40050	IP54
Duty type per VDE 0530 . . . . .	S1
Ambient temperature range . . . . .	0 to +40 °C
Pumped medium temperature range . . . . .	0 to +80 °C
Sealing material . . . . .	NBR, FKM (FPM)
Suction head, max. . . . .	1000 mm
Operating noise level . . . . .	Max. 60 dBA
Varnishing . . . . .	RAL 7024 graphite gray, special varnish available on customer request

### Materials

Pump housing . . . . .	Hydraulic cast (pressure-tight) with good wear and antifrictional properties
Tooth ring insert . . . . .	Sintered material
Shafts . . . . .	Low-deformation case-hardened steels
Bearing . . . . .	SKF plain bearing

### General notes on usage

During commissioning, pay attention to the pump's direction of rotation. See the rating plate and motor rotation arrow on the pump.

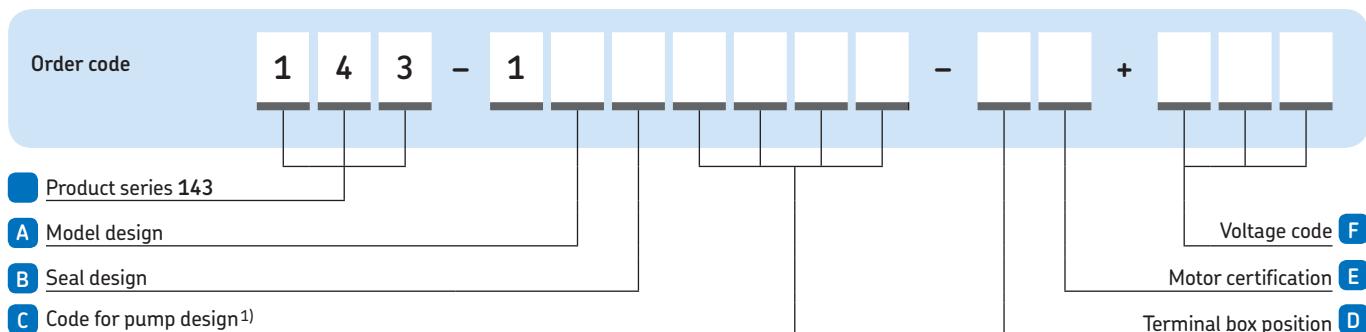

If using the pumps in systems without any open pressure lines, provide pressure-regulating valves to limit the maximum pressure of the system.

The selected cross-section of the intake tube must be equal to or greater than the cross-section of the pump's suction port.

SKF Lubrication Systems Germany AG recommends the use of filters for trouble-free operation of the pumps or pump units. Effective filtration prevents malfunctions while also increasing the service life of the pumps. A pumped medium of at least the purity class 20/17/14 according to ISO 4406(c) is recommended. This corresponds to the U.S. standard NAS code (1638) class 8 and SAW AS 4059 class 8. A filter rating of approx. 5 - 10 µm meets this requirement. The filter rating used is always based on the most sensitive component in the entire system. This is not necessarily the pump.

# IEC squirrel cage motors

## Fundamentals

### General information

The standard design of SKF gerotor pump units of product series 143 is driven by IEC squirrel cage motors from the motor manufacturer ATB. The motors are used in sizes 63 to 132, in 2-pole and 4-pole designs. They meet the relevant IEC/EN standards both mechanically and electrically. The standard design of the motors comes with a terminal box. The motors bear a CE marking in accordance with Low Voltage Directive 2006/95/EC. There is no CE marking with respect to Machinery Directive 2006/42/EC and EMC Directive 2004/108/EC because three-phase motors do not fall under the scope of these Directives.

### Special provisions

The motors can be ordered in a UL- and CSA-compliant design and are approved as a "recognized component" by UL (Underwriter Laboratories).

These motors have an electrical design according to NEMA MG1-12.

CSA BG56-80 File No.: LR 88093  
(listed under Master Contract No. 150227)

CSA BG90-132 File No.: LR 12638  
(listed under Master Contract No. 150227)

UL BG56-80 File No.: E123665  
(combined acceptance per UL 1004 and CSA 22.2.100)

UL BG90-132 File No.: E125750  
(combined acceptance per UL 1004 and CSA 22.2.100)

Further certifications are available on request

### Types

The motors are used exclusively in the types IM B34 and IM B14. The type is indicated according to Code I, DIN EN 60034-7 on the rating plate.

IM B34: Shaft horizontal, feet on floor

IM B14: Shaft horizontal, no feet

### Rated voltage, frequency, and power

The motors are designed standard for a rated motor voltage of 230 V, 400 V, or 690 V for 50 Hz networks (normal coils) according to DIN IEC 60038. Motors for other voltages and frequencies (special coils) are available at extra charge.

The permissible operating voltage deviation in the specified rated motor voltages and special voltages per DIN EN 60034-1 is  $\pm 10\%$  and the permissible frequency deviation is  $-5/+3\%$ .

The tolerances according to DIN EN 60034-1 are maintained at supply voltages on the order of 95% or 105% of the rated motor voltage. Further, motor heating may exceed the permissible temperature limit by 10 K. Higher heating is permissible, though continuous operation (duty) of the motors at higher temperature values is not recommended.

Motors for a rated motor voltage of 230 V or 400 V for 50 Hz networks (normal coil) and with performance  $< 0.75 \text{ kW}$  are designed for the wide voltage range for 50 and 60 Hz networks. The motors can be used in continuous duty (S1) within this wide voltage range. The wide voltage range is indicated on the motor's rating plate.

Wide voltage range:

50 Hz: 220–240 V / 380–420 V,

voltage tolerance  $\pm 5\%$

60 Hz: 254–280 V / 440–480 V,

voltage tolerance  $\pm 5\%$

The use of the wide voltage range is permitted because these motors are not subject to EU Directive 2005/32/EC (Energy Using Products) and therefore do not need to comply with EU Regulation No. 640/2009 with regard to adherence to efficiency classes. These motors do not bear an IE2 marking on the rating plate.

Motors for special voltages with performance  $< 0.75 \text{ kW}$  contain special coils that are designed for one voltage/frequency point (such motors are also referred to as tailor-made motors). Special voltage designs for 50 and 60 Hz networks are available at extra charge and must be indicated when ordering.

Motors with performance  $\geq 0.75 \text{ kW}$  are optimized for one voltage/frequency point and are designed solely on a tailor-made basis. They are designed standard for a rated motor voltage of 230 V, 400 V, or 690 V for 50 Hz networks (normal coils) according to DIN IEC 60038. They meet efficiency class IE2 according to EU Directive 2005/32/EC (Energy Using Products). These motors bear an IE2 marking on the rating plate.

Motors for special voltages with performance  $< 0.75 \text{ kW}$  contain special coils that are designed for one voltage/frequency point. Special voltage designs for 50 and 60 Hz networks are available for all rated motor voltages commonly used worldwide and must be indicated when ordering.

The stated performance ratings and operating values are valid for duty type S1 according to DIN EN 60034-1 at the indicated rated frequency, rated voltage, a coolant temperature of max. 40 °C, and a site altitude of up to 1000 m above sea level. Motors for operating conditions other than those indicated can be requested at extra charge.

### Circuit

The phase belts of the motor that are laid on the terminal board can be interconnected in two different connection systems.

#### Star connection

In the star connection, the coil ends U2, V2, and W2 are interconnected on the terminal board, creating the neutral point. Mains power is connected on the free connection ports of the coil ends U1, V1, and W1 on the terminal board.

#### Delta connection

In the delta connection, the end of the phase belt is interconnected with the beginning of the next phase belt. (U2 to V1, V2 to W1, W2 to U1). Mains power is connected at the connection points on the terminal board.

# IEC squirrel cage motors

## Cooling method

The motors are designed for cooling method IC 411 (surface cooling).

## Temperature class

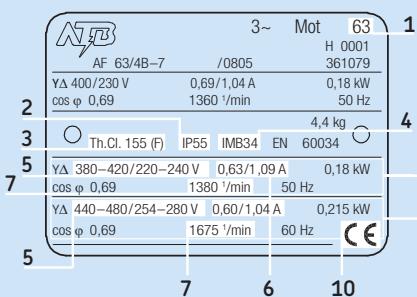

The insulation on the motor coils is designed for temperature class 155 (F). When utilized at their performance rating,

the motors meet temperature class 130 (B). Given a coolant temperature of 40°C, the power reserve is thus approx. +10%; when operated at their performance rating, the temperature reserve is approx. +20 K.

# IEC squirrel cage motors

## Technical data

Squirrel cage motor in foot design		Technical data	
		Type	Foot design IM B34, Flange design IM B14
		Protection class	IP55
		Temperature class	155 (F) utilized according to B
		Duty type	S1
		Temperature range	-20 to +40 °C
		Max. site altitude	1000 m above sea level
		Cooling method	IC 41 (surface cooling with fan)
		Temperature monitoring	none
		Frequency converter operation	According to DIN IEC / TS 60034-17 (VDE 0530 Part 17) 2004, suitable for converter operation for supply voltages up to and including 480 V
		Terminal box material	Metal

<sup>1)</sup> Flange with threaded hole acc. to DIN EN 50347 (FT).

<sup>2)</sup> Beyond a performance rating of 0.75 kW, the motors come with tailor-made coils. Wide voltage range motors only for performance ratings < 0.75 kW.

<sup>3)</sup> Beyond a performance rating of 0.75 kW, the motors are designed for efficiency class IE2.

<sup>1)</sup>Mounting flange acc. to DIN 50347.

<sup>2)</sup>Only standard terminal box position on top is supported, right is not possible.

For motor data, see Page 17.

# Viscosity-temperature relationship of oils with different rated viscosity

**Note:** The change in the viscosity of oils is disproportionately greater in lower temperature ranges than in higher temperature ranges. For example, an oil with a rated viscosity of 100 undergoes the following viscosity change in different temperature ranges at the same temperature difference:

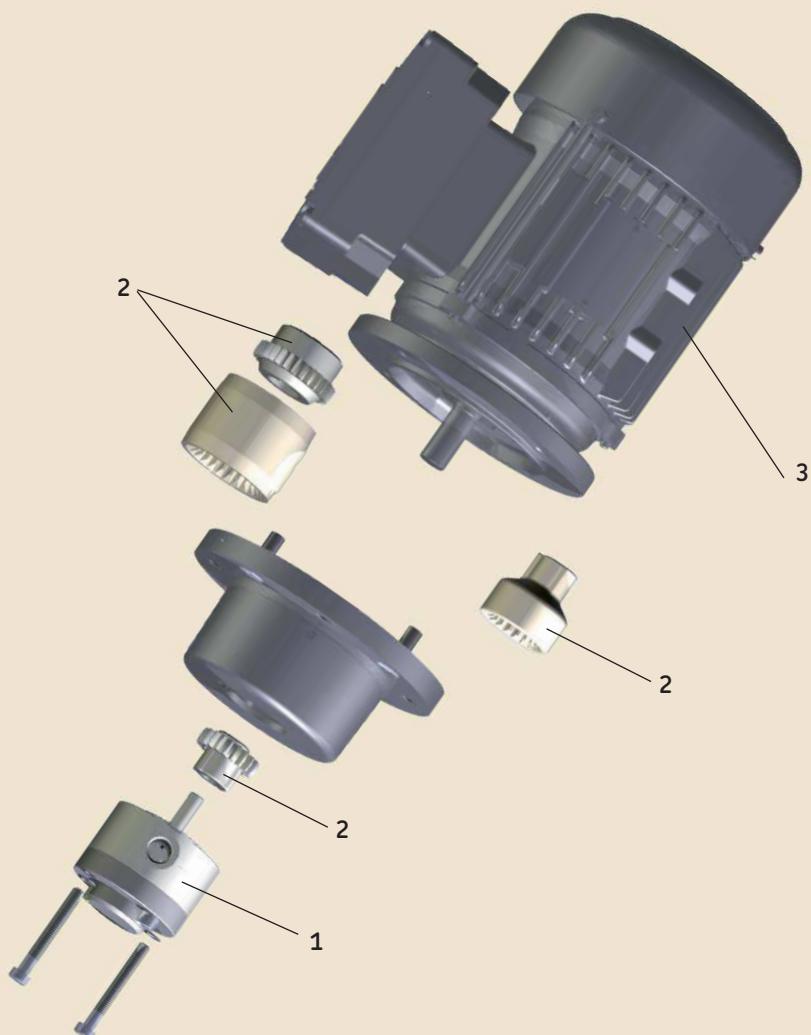

at +80 °C = 18 mm<sup>2</sup>/s  
versus  
at +75 °C = 21 mm<sup>2</sup>/s  
change of 3 mm<sup>2</sup>/s

at +10 °C = 875 mm<sup>2</sup>/s  
at + 5 °C = 1450 mm<sup>2</sup>/s  
change of 575 mm<sup>2</sup>/s

# Gerotor pump, product series 143

## Comparison of order numbers

Table 7

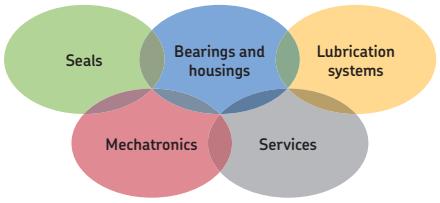

Comparison of old and new order Nos. for gerotor pump unit in foot design, product series 143

Nominal delivery rate [l/min]	Back press., max. [bar]	Permiss. oper. viscosity range [mm <sup>2</sup> /s]	Foot design			
			Old order No.	Seal design N (NBR)	Old order No.	Seal design F (FKM (FPM))
New order No.	New order No.	New order No.	New order No.	New order No.	New order No.	New order No.
0.85	30	20-1000	143-012-131+...	143-11NB03C-RA+1FX	-	143-11FB03C-RA+1FX
1.7	30	20-1000	143-012-141+...	143-11ND03E-RA+1FX	143-012-142+...	143-11FD03E-RA+1FX
2.5	20	20-1000	-	143-11NF02D-RA+1FX	-	143-11FF02D-RA+1FX
2.5	50	20-1000	-	143-11NF05F-RA+1FX	-	143-11FF05F-RA+1FX
5.25	20	20-1000	-	143-11NH02F-RA+1FX	-	143-11FH02F-RA+1FX
5.25	50	20-1000	-	143-11NH05J-0A+1GD	-	143-11FH05J-0A+1GD

### **The Power of Knowledge Engineering**

Combining products, people, and application-specific knowledge, SKF delivers innovative solutions to equipment manufacturers and production facilities in every major industry worldwide. Having expertise in multiple competence areas supports SKF Life Cycle Management, a proven approach to improving equipment reliability, optimizing operational and energy efficiency and reducing total cost of ownership.

These competence areas include bearings and units, seals, lubrication systems, mechatronics, and a wide range of services, from 3-D computer modelling to cloud-based condition monitoring and asset management services.

SKF's global footprint provides SKF customers with uniform quality standards and worldwide product availability. Our local presence provides direct access to the experience, knowledge and ingenuity of SKF people.
